Year-round HOUSES

All Tiny House houses we produce are year-round, by using the best insulation in line with the preferences of our customers.

ThermPIR AL. insulation board is a great insulation material in which the core of the board is made of rigid polyisocyanurate PIR foam, with very good thermal and fire insulation properties (in the case of roofs they provide fire resistance of REI 30- in the case of fire, the insulation carbonises and forms an additional protective layer) . It is light, does not burden the house, and at the same time gives stiffness to the whole structure (high level of resistance and compression strength- emissions of more than 12 tonnes (m2)). It has very good insulation properties in terms of thickness and weight. It is resistant to weather conditions thanks to low water absorption below 2%.

Due to their stability and durability, these boards retain their qualities until the buildings are in use. They can be reused after demolition. Disposal waste are a valuable raw material for the production of new products.

Métisse® is sustainable and environment friendly thermic and acoustic insulation. It is a safer alternative to conventional insulation materials. It consists of recycled denim and cotton and can be further recycled reducing the amount of generated wastes. Unlike the most common insulations it doesn't contain irritating substances and doesn't cause any allergic reactions. It is easy to use and disassemble. Thanks to its ability to absorb and release steam it does excellent job even in high humidity environments.

Sheep wool is a great insulator. It achieves the highest insulation values with its natural properties. Creates a healthy indoor climate. It is able to purify the air in very short time, removing unpleasant odours and harmful substances such as formaldehyde. It regulates humidity, can absorb up to 33% of its weight without losing its properties. insulation. It is a natural renewable material. As a natural product, can be returned to the environmental cycle at any time.

Types of THE HEATINGS

We offer our customers several heating solutions for their mobile homes:

Electric heating - the biggest advantage of this option is the space saving and convenience of use. Gives you the ability to control temperature remotely with Wi-Fi.

Infrared heating - the technology it uses is based on the use of light waves with a pleasant warmth comparable to sunlight. Infrared radiation is natural and safe, it has a positive effect on us.

Gas heating - a cost-effective solution with a gas heater with closed combustion chamber. This heating system makes you feel independent in places where there is no access to electricity.

Fireplace for wood or pellets - ideal solution for traditionalists who appreciate the natural warmth of the flames of burning wood and the accompanying climate, one of a kind.

The photo shows a fireplace for wood used in the Sunshine model.

Types of THE TOILETS

We can adapt the toilet to the customer's needs. Choice of toilets:

Classical toilet - will work well in a cottage that will not change location. It is comfortable, but needs a permanent connection to the sewage system and water.

Dry toilet - ecological, cheap and with the possibility of travelling. Its functioning does not require water or electricity. In order to use it, you only need the bulking material in the form of sawdust.

The composting toilet Separett Villa 9000 - is a modern, ecological, clean and odourless toilet. Liquid and solid waste shall be separated from each other in order to get rid of the unpleasant smell. Additionally, the toilet has an energy-saving, built-in fan, which keeps the toilet completely free of odors and moisture. Electricity is required to operate the toilet.

The photo shows the dry toilet used in the Porto model.

Photovoltaic PANEL SYSTEM

In our offer we have the possibility to install a system of photovoltaic panels.

One of its main advantages is its environmental friendliness. They are a renewable source of energy, which means that they only use a natural source of energy for their actions, which is solar radiation. This technology does not interfere with the natural environment and does not cause any damage to nature.

Right next to the ecology, the most important advantage of a photovoltaic system is the possibility of becoming independent of electricity suppliers (off-grid). Thanks to this you can put up your mobile home anywhere you want and you don't have to worry about the electricity.
